Introduction:

In this assignment, we are tasked with making a system to easily report information about populations for our organisation. Our main goal is to simplify getting this data by using a special type of database called SQL that we've been given. Our job is to ensure tasks are well-organised, gather what's needed for the project using stories and examples, and show good progress at the beginning.

We will achieve this by explaining tasks using stories, creating a picture (like a diagram) to show how different parts of the system connect and work together, connecting the project with Zube.io to manage it better, setting up boards to see how things are going and what's left to do, using GitHub to keep track of any issues or problems, and clearly explaining how the system will work and what it will do. Lastly, we'll take advantage of special boards to manage tasks during a specific time called a sprint.
